

MediAI Healthcare Assessment Report

Machine learning health assessment with educational care guidance

Report Generated	18 Aug 2026, 11:35 PM	Assessment Type	Educational only
Risk Level	Low	Health Score	100/100 - Excellent

Patient Snapshot

Patient Name	DEEPAK
Age	30 years
Gender	Male
Height / Weight	170.0 cm / 65.0 kg
BMI	22.49

Vitals and Context

Temperature	36.8 C - Normal
Blood Oxygen	98% - Optimal (Normal)
Duration / Severity	1 - 3 Days / Mild
Progress / Contact	Stable / No known exposure
Medical History	None reported
Emergency Symptoms	None

Possible Health Assessment

Model Suggestion	Bronchial Asthma
Confidence	38.00%

Symptoms Provided

high_fever, cough

Recommended Precautions

switch to loose clothing, take deep breaths, get away from trigger, seek help

Care Guidance

Possible Health Assessment

Based on the symptom profile and demographic indicators, the ML model identified **Bronchial Asthma** as the primary potential condition. Note that this is an educational screening assessment, not a confirmed clinical diagnosis.

Why this Condition May Fit

The reported symptoms (high fever, cough) combined with a duration of 1 - 3 Days and mild severity fit common presentation patterns for this condition. Lower respiratory involvement that can impact airway ventilation, oxygen exchange, and lung capacity.

Home Care & Recovery Protocol

- Use warm steam inhalation, stay in well-ventilated areas, rest in an elevated seating position, and continuously monitor SpO2 levels.
- Ensure adequate physical rest and maintain continuous hydration (water, clear broths, oral electrolytes).
- Keep a daily log of vitals (temperature, blood oxygen, pulse) and symptom changes.

Nutritional & Dietary Guidance

- Warm soups, herbal teas with honey, antioxidant-rich fruits, vitamin C sources, and ample warm water to thin mucus.
- Avoid heavy, oily, overly processed foods, and refrain from alcohol or tobacco during recovery.

Red Flag Warning Signs (Seek Urgent Care)

Seek immediate emergency medical attention if you experience:

- Sudden chest tightness, shortness of breath, or SpO2 dropping below 92%.
- High persistent fever unresponsive to antipyretics, severe confusion, or fainting.
- Blue-tinted lips/face, severe abdominal rigidity, or uncontrollable vomiting.
- *Emergency symptoms flagged: None noted.

When to Consult a Specialist

- Schedule a clinical appointment with a **Pulmonologist** or **Emergency Care** immediately if oxygen drops below 94% or breathing becomes labored.
- Immediate in-person medical evaluation is advised if symptoms persist beyond 48–72 hours, worsen in intensity, or interact with known medical history (None reported).

Important Clinical Note

Fever, body pain, or headaches alone cannot pinpoint a definitive diagnosis. Many conditions share overlapping symptom profiles. Comprehensive lab investigations (blood tests, imaging) conducted by a licensed healthcare provider are necessary for accurate treatment.
